

PRODUCT SPECIFICATION

9000 Series Mosaic

Introduction

Werner Electric's control & indicating instruments have been time tested for several years and can be used in our grid with tranquil methods of fixing. We integrate LED's for Indicating Alarms and Status Signals. Maintenance time and downtime incurred to replace the incandescent lamps that have a limited durability can be eliminated. In addition to this, danger of short circuits which exists when lamps are prevented efficiently.

It is very important for an operator to have full information and easy method of control and function displays. This is essential for effective control and monitoring of processes. Control and display panels with mosaic systems are best suited for this application.

A control and display panel majorly consists of the mosaic grid construction to which the mosaic tiles and control and display elements are fitted. Mimic diagram tiles and passive or active WERNER modules may be installed at any position on the panel's front. Measuring instruments can also be installed. Different mounting frames are available for the installation of the panel. A planning tool is also available for designing the layout of your panel.

Non-reflecting plastic tiles to cover the front of our models are given. Going further our technological process flow diagram images are imprinted on the tiles yielding an abrasion, scratch and graze proof mimic.

Grid Cutout

Tile/lamp remover tool # RT-01

Grid cross-line breaker # GB-01

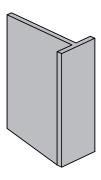

Side grid junction cutter # GC-01

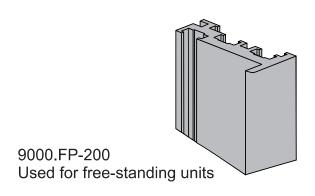

Corner grid junction cutter # GC-02

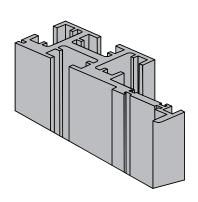

The grid module may be cut to any size. Cutouts for installation of instruments, such as meters, chart recorders, switches and so on... are made using WERNER ELECTRIC'S

Profiles

9000.FP-100 Used for free-standing units

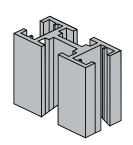

9000.FP-300 Used for large panel mount mosaics

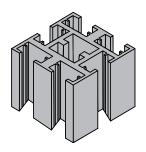

The front support profiles are sliced to the proper lengths relying upon the measure of the framework stage. They are secured to the grid framework by grid profile clasp sets and zinc-plated steel connectors. No drilling, tapping or welding is required .

A mosaic framework can be developed for board mounting or as a detached unit. The structure which bolsters the mosaic lattice framework is built of expelled aluminum profiles. These profiles incorporate front and back bolster profiles.

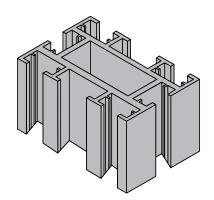

Support Profiles

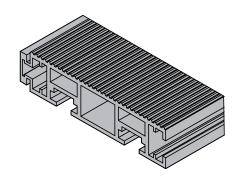

9000.P-800 48x 48 mm

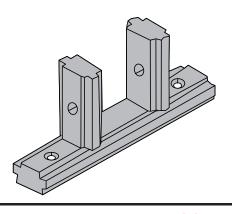

9000.P-900 48x 72 mm

Floor Profiles

9000.P-1000 24x 96 mm

9000.DT-01 Double T Connector

Accessories

Metal Grid

The mosaic framework depends on a metal grid made of Aluminum zinc Alloy furnished with mosaic tiles made of poly-carbonate. The essential matrix component measures 288x288 mm. It is especially appropriate for huge client interfaces and is self-supporting.

Design Goals

- Robust construction
- High load bearing capacity
- Grid pattern: 24x24, 24x48, 48x48 mm
- Mosaic tiles: polycarbonate, flame-retardant, selfextinguishing

Mosaic Tiles

Mosaic tiles shape the openly configurable surface of mosaic frameworks. Mosaic tiles can be engraved, or furnished with interchangeable content stripes.

The following sizes of mosaic tiles are available according to the IEC 61554 standard:

24x24 mm

24x48 mm

48x48 mm

All mosaic tiles are available in RAL7032 (pebble grey), RAL7035 (light grey) or RAL 1015 (light ivory). Other colors on request.

The mosaic tiles are made of polycarbonate and are self- extinguishing in less than 10 seconds (V-0 according to UL94).

Specifications

High Temperature Resistance	100°C for one hour
Non-Hygroscopic	Water Absorption : 0.18%
Gap Observations	< 0.026 to 0.055mm
Suitability for drilling and filing	Yes
High Mechanical Strength	Tensile Load of 50N for 10 sec
Chemical Composition of Grid	Alu Zinc

The Grid Module

The WERNER grid system is the simple assist structure of the mosaic picture display. it is made of grid modules assembled together to provide the required panel length. every module consists of a twelve through twelve matrix of 24 x 24 mm squares. It measures 288 x 288 mm (approximately 1 foot x 1 foot) with a intensity of thirteen mm. the fringe of the grid module is easy without a rough edges.

It's miles fabricated from precision die-solid zinc alloy. The fabric is corrosion-proof, lightweight and durable. The grid device can accommodate the standard WERNER tiles: 24 x 24mm, 24 x 48mm and forty eight x 48mm tiles; or any tile whose height and length is a more than one of 24mm.

The grid module can be assembled in any 90 degree orientation. No matter what size of graphic display is needed, the grid modules can be assembled to satisfy any design criterion.

Grid Assembly

The connection of one module to another is refined utilizing the network intersection screw set 9000.JS-24. The screw 9000.JS-24-01 and the knurled nut 9000.JS-24-02 are used to secure intersections between neighboring modules. These intersections lie between the cross-lines of the network. Lattice intersection screws are put at each 6th intersection.

Joining Grid Modules

Place two grid modules one next to the other and adjust the external half network intersections of first module with that of the second one to shape circles. Secure the two modules by embedding a framework intersection screw into the 6th intersection. Place a nut into the same intersection at the back. Fix the screw utilizing a screwdriver.

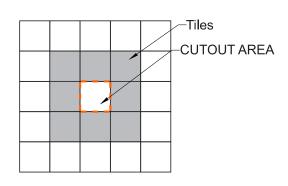

Proceed by adding a module to the highest point of the first and another to the highest point of the second. Secure these new ones with framework intersection screws and nuts, again at each 6th intersection. Subsequent to gathering the four modules, embed a last framework intersection screw at the intersection where the four modules meet. Every module will contain a quarter intersection which joins with its adjoining partners to frame a complete circle. Continue including modules the same path until the wanted size is achieved.

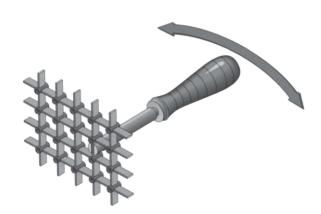

The joined grid modules result in a solid structure with no shortcoming at the joints. The general grid framework has no edges or holes, along these lines wiping out any light infiltration when mosaic tiles are mounted.

Cutting the Cross-lines

Cutting the cross-lines of the grid is required just for gadgets which require a complete opening. Before mounting an instrument, decide its area on the mosaic showcase and the zone it will possess. Expel the mosaic tiles which possess this space in addition to those which encompass it.

Select a cross-line which is situated inside within edge of the set pattern territory. Embed the cross-line into the breaker's space. With a movement opposite to the cross-line's course, move the breaker forward and backward until the cross-line breaks. Rehash this method for the staying cross-lines inside the border until the required set pattern territory is opened.

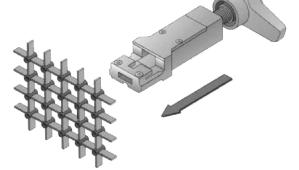

Removing half and quarter junctions

Once the cross-lines are evacuated, the opening will contain grid intersections parts and quarters along the internal sides and corners of the opening's edge, separately. Contingent upon the instrument, it might be important to trim these parts to accomplish straight edges and right edge corners. This is finished by utilizing the side furthermore, corner lattice intersection cutters.

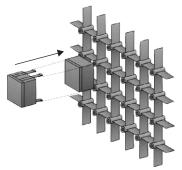

Turn the tool's handle clockwise to decrease the cutting guide's distance. Keep turning the handle until the junction half is removed. This process is repeated until all junction halves are cut.

To cut the quarter intersections at the corners, the corner intersection cutter is utilized after a comparative methodology.

Mosaic Tiles

The essential component of a realistic showcase is the mosaic tile. Mounted on WERNER mosaic grid platform, they are intended to be held solidly in position with the goal that vibration does not make them move or fall. They are secured to the lattice by four necessarily shaped legs. No screws, cams or clasp are required to hold the tiles set up. At the point when mounted, the tiles have no even or vertical development. Therefore, the surface of the mosaic has no edges or crevices.

Mosaic tiles are utilized to show static data or to hold gadgets. Set patterns can be made in the tile for any sort of selector switch, push catch or light. As a result of its measured configuration, a tile can be expelled from the framework and moved to whatever other spot on the grid matrix without influencing contiguous segments.

Composition

Mosaic tiles are made of excellent poly-carbonate with fire resistant and self-dousing properties. This material displays high warm resistance with a temperature rating of 100 °C (212 °F) constant and 125 °C (257 °F) irregular. Its surface is non-intelligent, hostile to static and smooth. It is exceptionally impervious to ultra-violet beams.

Dimension

Standard tiles come in the following sizes: 24×24 mm, 24×48 mm and 48×48 mm. The tile has a minimum tile body length of 15 mm (not including the length of its legs). It's tolerance is +0.0 mm and 0.06 mm. The gap between adjacent tiles on the grid is 0.1 mm and discontinuity between the corners of adjacent tiles is less than 0.2 mm.

Colors

The following standard tile colors are used as background:

- Grey
- Ivory
- Green
- Black
- White translucent

If the desired background color is not among the standard ones shown above, tiles can be painted to any color available on WERNER mosaic color chart.

The translucent tiles are utilized for annunciation. WERNER mosaic glowing or LED pointers are put behind these tile for backdrop illumination. Any window size can be obliged, essentially by consolidating tiles in the X and Y course.

Engraving

Static data of the framework to be emulated is spoken to by lines and images which are engraved on the tiles. The graphical format is created utilizing a Computer Aided Design (CAD) program. An electronic imprinting machine utilizes the CAD created record to deliver an exact representation of the format.

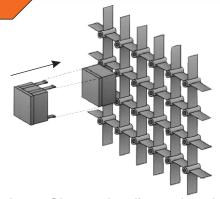

Every line and image is painstakingly composed at the focal point of tile (unless required generally) so that movement of this tile to another part of the realistic is effortlessly refined.

Painting

After the tiles are engraved, they are secured with a plastic film. This film is expelled for ranges which require the same paint shading. The tiles are then air-splash painted with a uniform covering. The veiling and painting procedure is proceeded until every one of the hues are connected to the tiles. The last stride includes filling the depressions of the lines and images with an uncommon changeless, non-glare ink. The paint and ink are perpetual and won't blur with time. The tiles are then wiped with a perfect clammy fabric. Overwhelming obligation solvents ought not be utilized to clean the tile surface.

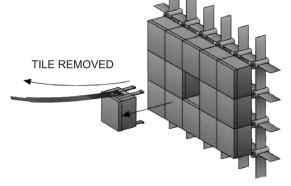

Inserting and Removing Tiles

Hold the tile with your thumb and pointer. Situate the tile so that the sides which contain the legs are the same sides which you are holding with the your thumb and pointer. Embed one of the legs into the lattice square. Delicately squeeze this leg against the network's cross-line and snap in the other leg. Whenever mounting the following tile, situate by 90 degrees contrasted with the one effectively mountedand take after the same system.

Removing the Tile

The tile can be expelled in two ways. Either from the back by pushing the tile out with your forefinger or by utilizing WERNER mosaic tile/light remover instrument 9000.RT-01. Embed the level segment of the tile remover between the two tiles. Ensure that the indented opening on the instrument's level segment is confronting the tile you need to expel. Once the device is embedded, tenderly force it straight out. This will snap out the tile.
